

## **VASSAN PROPERTY**

### **Description**

The Vassan Property is composed of eight contiguous mining claims (320 hectares) situated in the Vassan Township (lots 8 to 15 of Range IV), in the Val-d'Or mining camp, in Québec.

### **Location**

This property is situated approximately 15 km northwest of the western limit of the City of Val-d'Or. The claims are located 2 km north of the western limit of the DeMontigny Lake.

### **Access**

It is relatively easy to access the property by a gravel road leading to Vassan Lake, via Regional Highway 117 westbound, immediately after the village of Dubuisson. From there, proceeding north, a gravel tertiary road takes us to within 500 metres of the south-western corner of the property. All-terrain vehicle trails crisscross the property in the south-west and north-south directions.

### **Mineralization**

This property presents a favourable geological context for different types of mineralization, such as gold-bearing, volcanic sulphides and platinoids. To date, no significant mineralization was found on the property, except for the presence of some small veins of quartz-carbonate with traces to 2% disseminate pyrite. Some shear zones and small pyrite veins were observed by drilling West of the Property by Falconbridge Ltd. The most significant mineralization in the area surrounding the Property is found on the Wesdome and Callahan deposits, southerly.

### **Work and conclusion**

The property is located in a favourable geological context for different types of mineralization, such as auriferous in the veins inside the Vassan intrusive, volcanogenic sulphides in the intermediate to mafic volcanic sequences and of the platinoids type mineralization in the ultramafic sequences of the Dubuisson Formation. However, since only minimal information is available on the drilling, the geology and the geophysical of this property, additional exploration works will be necessary to statute on the potential of this project. No work is planned on this property during 2004.
